

IN THE U.S. PATENT AND TRADEMARK OFFICE

Applicant: CHRISTENSEN, Carlos M. et al. Conf.:
Appl. No.: New Group:
Filed: April 25, 2001 Examiner:
For: RF HOME AUTOMATION SYSTEM COMPRISING REPLICABLE
CONTROLLERS

PRELIMINARY AMENDMENT

Assistant Commissioner for Patents
Washington, DC 20231

April 25, 2001

Sir:

The following preliminary amendments and remarks are respectfully submitted in connection with the above-identified application.

AMENDMENTS

IN THE CLAIMS:

Please amend the claims as follows:

3. (Amended) An automation system according to claim 1, wherein the organized data structure of the first memory of the first controller further holds alphanumerical data in relation to each device identifier as well as in relation to groups of device identifiers, and wherein the one or more signals generated by the first controller further comprises said alphanumerical data, and wherein the processor of the second controller is further adapted to

store the alphanumeric data correspondingly in the corresponding organized data structure of the first memory of the second controller.

7. (Amended) An automation system according to claim 1, wherein the first memory of the first controller comprises a routing table indicating, for each device, other devices which can receive and process a signal transmitted by said device, and wherein the one or more signals generated by the first controller further comprises the routing table of the first controller, and wherein the processor of the second controller is further adapted to store said routing table in the first memory and wherein the processor of the second controller comprises means for identifying device identifiers in the routing table of devices for repeating a transmitted signal having a predetermined destination identifier and to include said device identifiers as repeater identifiers in the transmitted signal.

8. (Amended) An automation system according to claim 1, wherein said one or more signals comprises a frame comprising a command in relation to each device identifier instructing the processor of the second controller as to where in the organized data structure of its first memory to store the device identifier.

9. (Amended) An automation system according to claim 1, wherein the processor of the first or the second controller further comprises means for, before storing said device identifiers in the first memory of the second controller, erasing all information related to device identifiers in the first memory of the second controller.

10. (Amended) An automation system according to claim 1, wherein the processor of the second controller is adapted to, when storing said device identifiers correspondingly in the organized data structure of the first memory of the second controller, overwrite all information related to device identifiers in the first memory.

11. (Amended) An automation system according to claim 1, wherein the processors of the first and second controllers further comprise means for dynamically assigning controller identifiers to a controller upon introduction of the controller in the system, said means assigning controller identifiers using a predetermined sequence of controller identifiers.

13. (Amended) An automation system according to claim 1, wherein the processors of the first and second controllers further comprise means for dynamically assigning device identifiers to a device upon introduction of the device in the system, said means assigning device identifiers using a predetermined sequence of device identifiers.

17. (Amended) A method according to claim 15, wherein the step of storing said device identifiers correspondingly in the organized data structure of the memory of the second controller comprises the step of overwriting corresponding device identifiers already stored in the memory of the second controller.

18. (Amended) A method according to claim 15, characterized in that it makes the second controller a replication of the first controller in terms of controlling the devices of the system, the method further comprising the step of, before storing said device identifiers in the memory of the second controller, erasing all information related to device identifiers in the memory of the second controller.

19. (Amended) A method according to claim 15, characterized in that it makes the second controller a replication of the first controller in terms of controlling the devices of the system and in terms of set-up and learning of the system, wherein the signal further comprises instructions related to the set-up and learning of the system.

REMARKS

The amendment to the claims is merely to delete multiple dependencies and to place the application into better form for examination. Entry of the present amendment and favorable action on the above-identified application are earnestly solicited.

Attached hereto is a marked-up copy of the changes made to the application by this Amendment.

If necessary, the Commissioner is hereby authorized in this, concurrent, and future replies, to charge payment or credit any overpayment to Deposit Account No. 02-2448 for any additional fees required under 37 C.F.R. § 1.16 or under 37 C.F.R. § 1.17; particularly, extension of time fees.

Respectfully submitted,

Attachment: Version with Markings Showing Changes Made

(Rev. 01/22/01)

VERSION WITH MARKINGS TO SHOW CHANGES MADE

The claims have been amended as follows:

3. (Amended) An automation system according to claim 1 [or 2], wherein the organized data structure of the first memory of the first controller further holds alphanumerical data in relation to each device identifier as well as in relation to groups of device identifiers, and wherein the one or more signals generated by the first controller further comprises said alphanumerical data, and wherein the processor of the second controller is further adapted to store the alphanumerical data correspondingly in the corresponding organized data structure of the first memory of the second controller.

7. (Amended) An automation system according to [any of the preceding claims]claim 1, wherein the first memory of the first controller comprises a routing table indicating, for each device, other devices which can receive and process a signal transmitted by said device, and wherein the one or more signals generated by the first controller further comprises the routing table of the first controller, and wherein the processor of the second controller is further adapted to store said routing table in the first memory and wherein the processor of the second controller comprises means for identifying device identifiers in the routing table of devices for

repeating a transmitted signal having a predetermined destination identifier and to include said device identifiers as repeater identifiers in the transmitted signal.

8. (Amended) An automation system according to [any of the preceding claims]claim 1, wherein said one or more signals comprises a frame comprising a command in relation to each device identifier instructing the processor of the second controller as to where in the organized data structure of its first memory to store the device identifier.

9. (Amended) An automation system according to [any of the preceding claims]claim 1, wherein the processor of the first or the second controller further comprises means for, before storing said device identifiers in the first memory of the second controller, erasing all information related to device identifiers in the first memory of the second controller.

10. (Amended) An automation system according to [any of the preceding claims]claim 1, wherein the processor of the second controller is adapted to, when storing said device identifiers correspondingly in the organized data structure of the first memory of the second controller, overwrite all information related to device identifiers in the first memory.

11. (Amended) An automation system according to [any of the preceding claims]claim 1, wherein the processors of the first and second controllers further comprise means for dynamically assigning controller identifiers to a controller upon introduction of the controller in the system, said means assigning controller identifiers using a predetermined sequence of controller identifiers.

13. (Amended) An automation system according to [any of the preceding claims]claim 1, wherein the processors of the first and second controllers further comprise means for dynamically assigning device identifiers to a device upon introduction of the device in the system, said means assigning device identifiers using a predetermined sequence of device identifiers.

17. (Amended) A method according to claim 15 [or 16], wherein the step of storing said device identifiers correspondingly in the organized data structure of the memory of the second controller comprises the step of overwriting corresponding device identifiers already stored in the memory of the second controller.

18. (Amended) A method according to claim 15 [or 16], characterized in that it makes the second controller a replication of the first controller in terms of controlling the devices of the system, the method further comprising the step of, before storing said device identifiers in the memory of the second controller, erasing all information related to device identifiers in the memory of the second controller.

19. (Amended) A method according to [any of claims 15 to 18]claim 15, characterized in that it makes the second controller a replication of the first controller in terms of controlling the devices of the system and in terms of set-up and learning of the system, wherein the signal further comprises instructions related to the set-up and learning of the system.
